

# Define the purpose of the processing in the development phase

---

## Case 1

The operational use of the AI system during the deployment phase is identified from the development phase

If the purpose in the deployment phase is specified, explicit and legitimate, it is also considered that the purpose in the development phase is specified, explicit and legitimate.

## Case 2

The operational use of the AI system during the deployment phase is not clearly defined from the development phase (general purpose AI systems)

The purpose of the processing in the development phase must refer cumulatively to:

- to the 'type' of system developed
- technically feasible functionalities and capabilities

It is recommended that the purpose also include:

- the most at-risk foreseeable capabilities
- functionalities excluded by design
- as far as possible, the conditions of use of the AI system

## Special case

Creating a training dataset for scientific research purposes

It may be acceptable for the objective to be specified with a lower degree of precision, or for the research objectives not to be specified in their entirety, given the difficulties in defining it entirely from the beginning.
